

# Print Item Labels during Picking

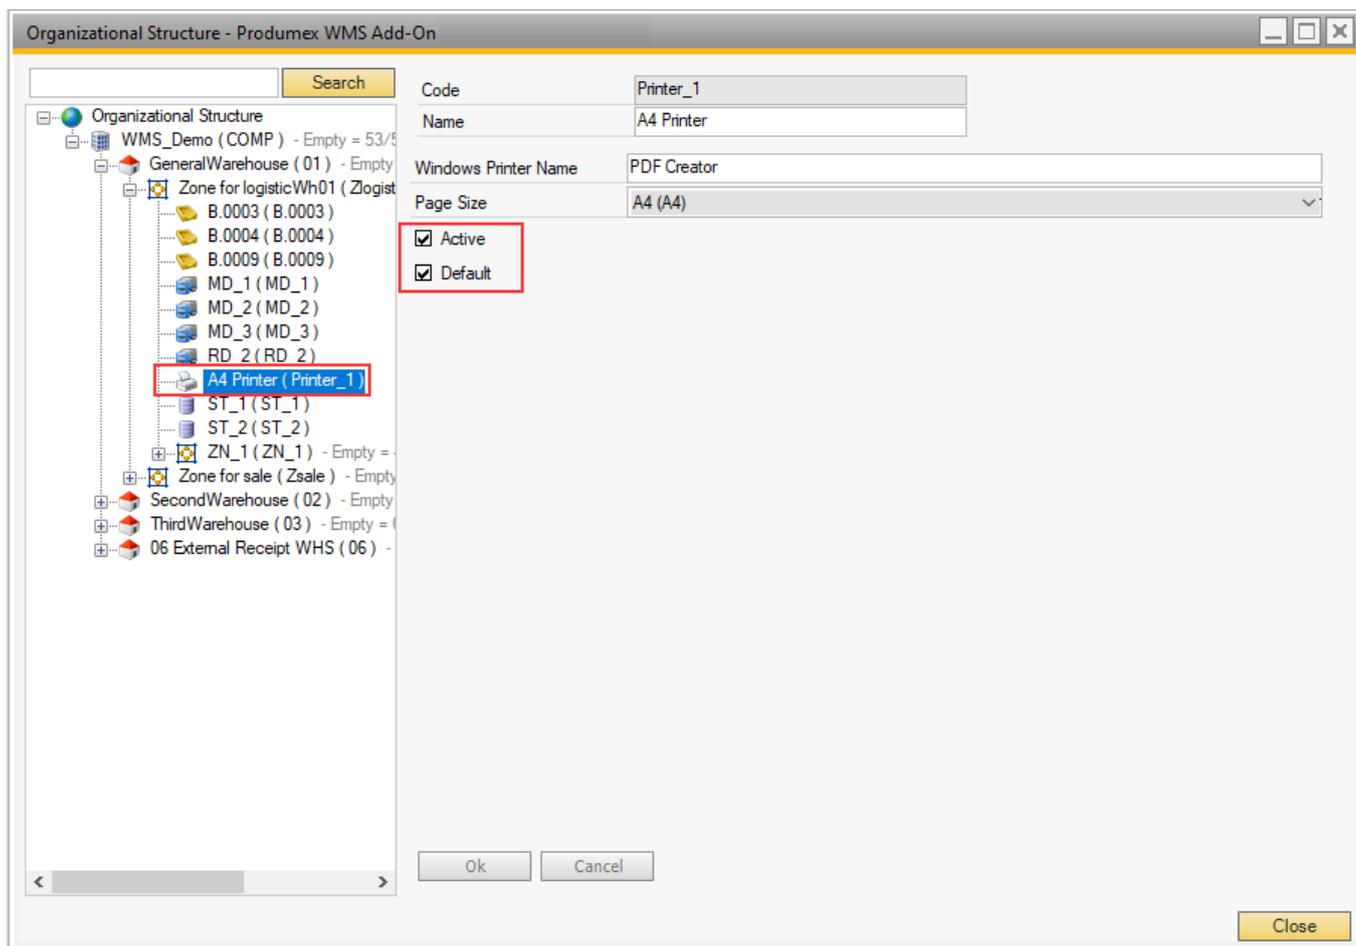

## Overview

This documentation describes the configuration steps of printing item labels during the following picking flows:

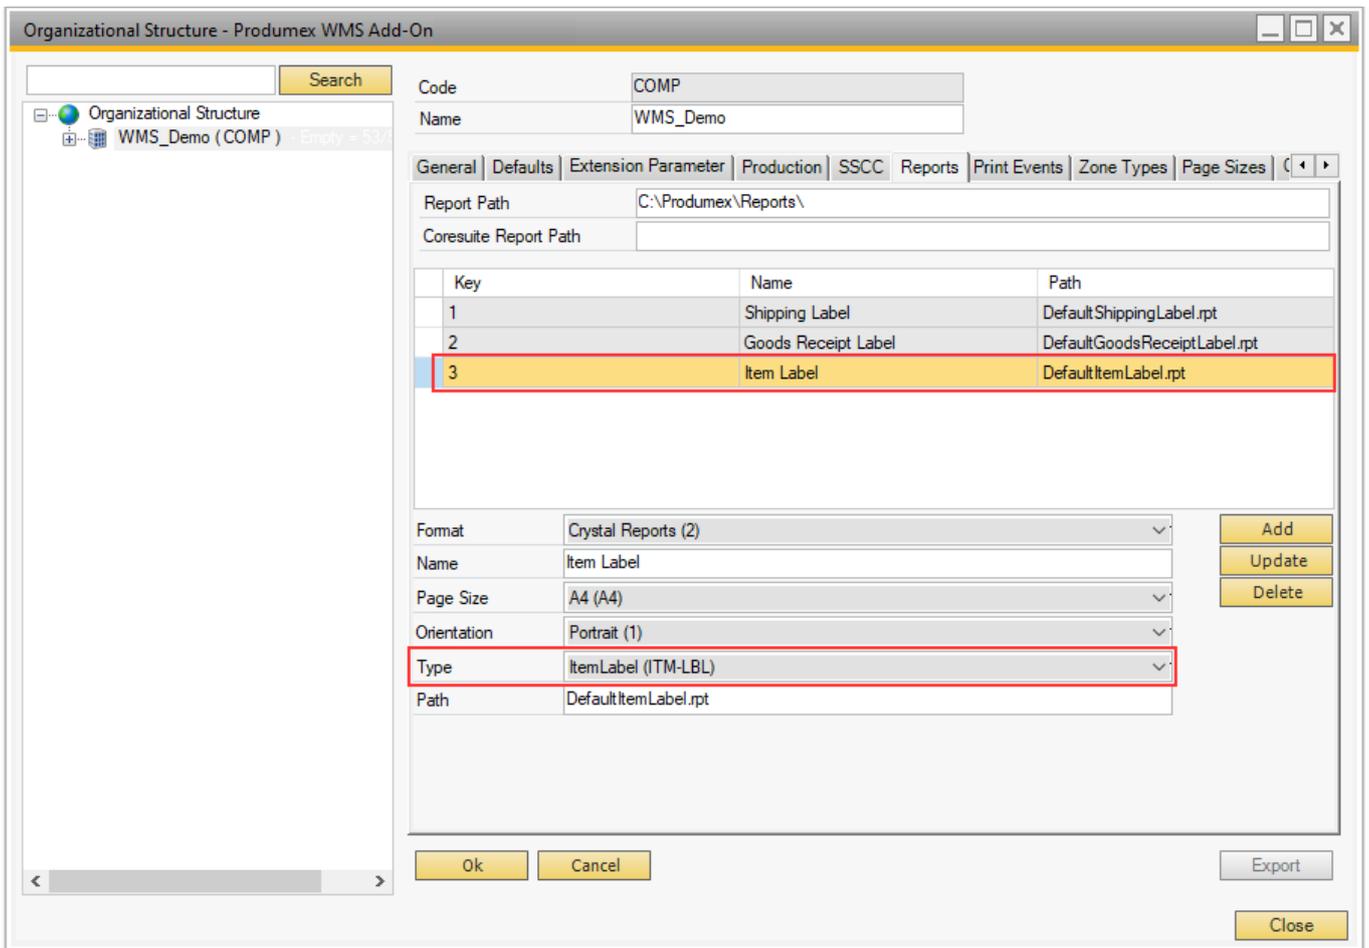

- [Picking Flow](#)
- [Multi-Picking Flow](#)
- [Zone Picking Flow](#)
- [Box Pick and Pack Flow](#)
- [Zone Box Picking Flow](#)

## Configuration

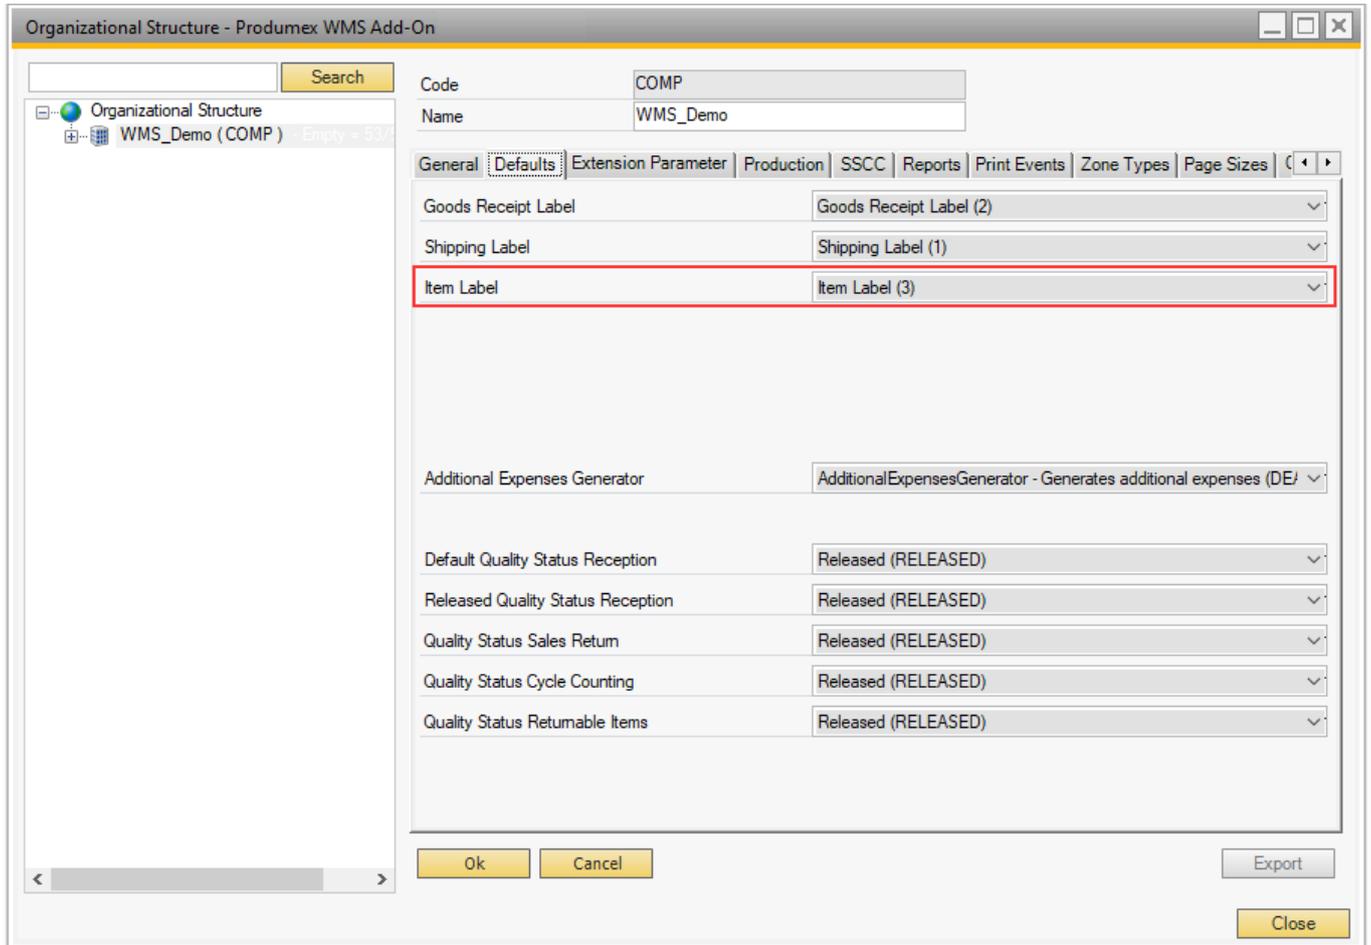

1. In your Organizational Structure create a printer in the warehouse where the picking process is performed. Set the printer as the default printer.

2. On the Reports tab of the Organizational Structure add a report with Item Label type.

3. On the Defaults tab of the Organizational Structure set the report as the default item label.

4. In the Item Master data window go to Produmex > Sales tab and enable the Print Label During Picking option for the given item.

If you have a picklist with different items, the system prints item labels only for those items for which the Print Label During Picking option is enabled.
