

Move Guide

Overview

Moves can be used to transfer stock within or between warehouses. Produmex offers several specialized flows for the different scenarios in stock relocation:

- [Ad Hoc Movement Flow](#): to move stock within or between PMX managed warehouses without a move order created in the office environment
- [Move Order Flow](#): to move stock within or between PMX managed warehouses based on move orders created in the office environment
- [Replenish Pick Locations Flow](#): to move stock based on system generated replenishment orders
- [Consolidated Move Flow](#): to execute ad hoc moves in a group within a PMX warehouse
- **Move from WA Location Flow**: to move stock from a warehouse automation location
- [Receive from WHS Flow](#): to move stock from a warehouse not managed by PMX to a PMX warehouse

Default location calculation

When the location suggestion is enabled for the warehouse, the *Default location* is the first suggested location calculated based on the logic described in [Location suggestions](#).

When the location suggestion is not enabled for the warehouse, the *Default location* is the standard location set for the given warehouse on the [Produmex Inventory tab](#) of the Item Master Data of the item. If the items to move have different standard location set for the warehouse, no default location is displayed.

View move documents

When a movement has been carried out on the shopfloor, it is also registered administratively in the Produmex Office module where it can be consulted. To see the movements, open the 'Move' screen via the following path: Produmex > Inventory > Move.
